## I Vector algebra

### I.1 Coordinate Transformation

#### I.1.1 cylindrical

$$x = \rho \cos \varphi$$

$$y = \rho \sin \varphi$$

$$z = z$$

reverse

$$\rho = \sqrt{x^2 + y^2}$$

$$\cos \varphi = \frac{x}{\rho}$$

$$\sin \varphi = \frac{y}{\rho}$$

#### I.1.2 spherical

$$x = \rho \sin \varphi \cos \theta$$

$$y = \rho \sin \varphi \sin \theta$$

$$z = \rho \cos \varphi$$

reverse

$$\rho = \sqrt{x^2 + y^2 + z^2}$$

$$\cos \varphi = \frac{z}{\rho}$$

$$\cos \theta = \frac{x}{r}$$

$$\sin \theta = \frac{y}{r}$$

## I.2 Dot product

- commutative
- positive definite
- distributive
- cauchy-schwarz inequality

## I.3 cross product

- anticommutative  $\vec{u} \times \vec{v} = -(\vec{v} \times \vec{u})$
  - distributive  $\vec{u} \times (\vec{v} + \vec{w}) = \vec{u} \times \vec{v} + \vec{u} \times \vec{w}$
  - scalar multiplication
  - triple scalar product  $\vec{u} \cdot (\vec{v} \times \vec{w}) = (\vec{u} \times \vec{v}) \cdot \vec{w}$
  - triple vector product  $\vec{a} \times (\vec{b} \times \vec{c}) = (\vec{b} \cdot \vec{a})\vec{c} - (\vec{c} \cdot \vec{a})\vec{b}$
- 

# II Vector calculus

## II.1 Arc length

- Def: Given a curve  $\vec{r}(u) = (x(u), y(u), z(u))$  for  $a \leq t \leq b$  the length of the curve S, as a function of time is given by

$$S(t) = \int_a^t \|\dot{\vec{r}}(u)\| du$$

where  $\|\dot{\vec{r}}(u)\| = \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2 + \left(\frac{dz}{dt}\right)^2}$

- Curvature:

$$K(t) = \frac{\|\dot{T}(t)\|}{\|\dot{\vec{r}}(t)\|} = \frac{\|(\dot{\vec{r}}(t) \times \ddot{\vec{r}}(t))\|}{(\|\dot{\vec{r}}(t)\|)^3}, \text{ where } T(t) = \frac{\dot{\vec{r}}(t)}{\|\dot{\vec{r}}(t)\|}$$

## II.2 Line integration

- for curve  $\vec{r}(t) = (x(t), y(t))$

$$\int_C f(x(t), y(t)) \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} dt$$

- center of mass  $(\bar{x}, \bar{y}, \bar{z})$ , where

$$\begin{cases} \bar{x} = \left(\frac{1}{M}\right) \int_C \rho(x, y, z) x ds \\ \bar{y} = \left(\frac{1}{M}\right) \int_C y \rho(x, y, z) ds \\ \bar{z} = \left(\frac{1}{M}\right) \int_C z \rho(x, y, z) ds \end{cases}$$

- Work done by force  $F$  along curve,  $\vec{r}(t)$ , which can be generalized into the formula for line integration,

$$W = \int_C \vec{F} \cdot d\vec{r} = \int_C \vec{F} \cdot \vec{T} ds = \boxed{\int_a^b F[x(t), y(t)] \cdot (\dot{r}(t)) dt}$$

- When vector field  $\vec{F} = \vec{F}(x, y, z) = (P, Q, R)$ ,

$$\int_C \vec{F} \cdot d\vec{r} = \int_C P dx + Q dy + R dz$$

## II.3 Surface integration

- Parametric representation of surface:

$$\begin{cases} x = x(u, v) \\ y = y(u, v) \\ z = z(u, v) \end{cases}$$

- Use normal vector at a point  $(u_0, v_0)$  of surface to represent tangent plane.

$$\vec{r}_v = \frac{\partial \vec{r}}{\partial v}(u_0, v_0), \vec{r}_u = \frac{\partial \vec{r}}{\partial u}(u_0, v_0)$$

$$\vec{N} = \vec{r}_u \times \vec{r}_v$$

- Surface area of a surface  $S$  with  $(u, v) \in D$

$$A(S) = \iint_D \|\vec{r}_u \times \vec{r}_v\| du dv$$

## II.4 Jacobian

- Def: Given a transformation  $(u, v) \in D \longrightarrow [x(u, v), y(u, v)] \in S$ , the Jacobian is given by

$$J(u, v) = \frac{\partial(x, y)}{\partial(u, v)} \equiv \det \begin{pmatrix} \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} \\ \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} \end{pmatrix}$$

- Jacobian in coordinate transformation

$$\iint_S f(x, y) \, dA = \iint_D f(x(u, v), y(u, v)) |J(u, v)| \, du \, dv$$

## II.5 Gradient

- Nabla operation:

$$\nabla = \frac{\partial}{\partial x} + \frac{\partial}{\partial y} + \frac{\partial}{\partial z}$$

- Gradient in cartesian Scalar field  $f = f(x, y, z)$

$$\nabla f = \left( \frac{\partial f}{\partial x}, \frac{\partial f}{\partial y}, \frac{\partial f}{\partial z} \right)$$

- Gradient in polar coordinates  $f = f(r, \theta)$

$$\nabla f = \vec{e}_r \frac{\partial f}{\partial r} + \vec{e}_\theta \frac{1}{r} \frac{\partial f}{\partial \theta}$$

$$\text{where } \vec{e}_r = \frac{x}{\|x\|} = (\cos \theta, \sin \theta) \vec{e}_\theta = (-\sin \theta, \cos \theta)$$

$$\nabla = \vec{e}_r \partial_r + \vec{e}_\theta \frac{1}{r} \partial_\theta$$

- Gradient in spherical

$$\nabla f = \hat{\rho} \partial_\rho + \hat{\varphi} \frac{1}{\rho} \partial_\varphi + \hat{\theta} \frac{1}{\rho \sin \varphi} \partial_\theta$$

- Gradient of scalar field in spherical coordinates

$$\text{Let } g(\rho, \varphi, \theta) = f(x, y, z)$$

$$\begin{cases} x = \rho \sin \varphi \cos \theta \\ y = \rho \sin \varphi \sin \theta \\ z = \rho \cos \varphi \end{cases} \quad \begin{bmatrix} \partial_\rho g \\ \partial_\varphi g \\ \partial_\theta g \end{bmatrix} = \begin{bmatrix} \partial_\rho x & \partial_\rho y & \partial_\rho z \\ \partial_\varphi x & \partial_\varphi y & \partial_\varphi z \\ \partial_\theta x & \partial_\theta y & \partial_\theta z \end{bmatrix} \begin{bmatrix} \partial_x f \\ \partial_y f \\ \partial_z f \end{bmatrix}$$

$$\begin{aligned} \hat{\rho} &= (\partial_\rho x, \partial_\rho y, \partial_\rho z) = \frac{(x, y, z)}{\rho} \\ \hat{\varphi} &= \frac{1}{\rho} (\partial_\varphi x, \partial_\varphi y, \partial_\varphi z) \\ \hat{\theta} &= \frac{1}{\rho \sin \varphi} (\partial_\theta x, \partial_\theta y, \partial_\theta z) \end{aligned} \quad \Rightarrow \quad \begin{bmatrix} \partial_x f \\ \partial_y f \\ \partial_z f \end{bmatrix} = \begin{bmatrix} \hat{\rho}_1 & \hat{\varphi}_1 & \hat{\theta}_1 \\ \hat{\rho}_2 & \hat{\varphi}_2 & \hat{\theta}_2 \\ \hat{\rho}_3 & \hat{\varphi}_3 & \hat{\theta}_3 \end{bmatrix} \begin{bmatrix} \partial_\rho g \\ \frac{1}{\rho} \partial_\varphi g \\ \frac{1}{\rho \sin \varphi} \partial_\theta g \end{bmatrix}$$

## II.6 Divergence

- div of vec field:

3D:

$$\nabla \cdot \vec{F} = \frac{\partial F_1}{\partial x} + \frac{\partial F_2}{\partial y} + \frac{\partial F_3}{\partial z}$$

- Div in polar 2D

$$\vec{U} = U_r \hat{r} + U_\theta \hat{\theta}, \text{ where } U_r = U \cdot \hat{r}, U_\theta = U \cdot \hat{\theta}$$

$$\nabla \cdot U = \left( \frac{1}{r} \right) \frac{\partial(rU_r)}{\partial r} + \frac{\partial U_\theta}{\partial \theta}$$

- Div in spherical coord

$$\vec{U} = U_\rho \hat{\rho} + U_\theta \hat{\theta} + U_\varphi \hat{\varphi},$$

$$\nabla \cdot \vec{U} = \frac{1}{\rho^2} \frac{\partial(\rho^2 U_\rho)}{\partial \rho} + \frac{1}{\rho} \sin \varphi \frac{\partial(U_\theta)}{\partial \theta} + \frac{1}{\rho \sin \varphi} \frac{\partial(U_\theta \sin \varphi)}{\partial \varphi}$$

## II.7 Green's theorem

$$\int_C P dx + Q dy = \iint_D \frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y} dA = \iint_C \vec{F} \cdot d\vec{r}$$

## II.8 Stokes' theorem

- for a surface,

$$\vec{r}(u, v) = (x(u, v), y(u, v), z(u, v))$$

$$\Rightarrow \iint_S \vec{F} \cdot d\vec{S} = \iint_S \vec{F} \cdot \vec{n} dS = \iint_D \vec{F}(\vec{r}(u, v)) \cdot (\vec{r}_u \times \vec{r}_v) dA$$

- if the surface is a graph of a function  $z = g(x, y), (x, y) \in D, \vec{F} = (P, Q, R)$ , then

$$\int_S \vec{F} \cdot d\vec{s} = \iint_D (P, Q, R) \cdot (-\partial_x g, -\partial_y g, 1) dA$$

Let  $F : R^3 \rightarrow R^3$  be a vector field on  $R^3$ , then

$$\int_C \vec{F} \cdot d\vec{r} = \iint_S \text{curl}(\vec{F}) \cdot d\vec{s},$$

$$\text{where } \text{curl}(\vec{F}) = \nabla \times \vec{F}$$

## III Complex analysis

### III.1 Complex numbers and basic operations

#### III.1.1 Definitions

- Def:  $i^2 = -1$
- Complex number:  $z = x + iy$
- Conjugate:  $z = x - iy$
- Real part:  $\Re(z) = x$ , Imaginary part:  $\Im(z) = y$
- Modulus/ Norm/ Magnitude:  $|z| = \sqrt{x^2 + y^2}$
- Polar form:  $z = |z| (\cos \theta + i \sin \theta) = re^{i\theta}$
- Argument(angle) :  $\arg(z) = \theta$  such that  $z = |z| (\cos \theta + i \sin \theta)$ . Angle between vector  $(x, y)$  with real axis

#### III.1.2 operations

- addition:  $z_1 + z_2 = (x_1 + x_2) + i(y_1 + y_2)$
- multiplication:  $z_1 z_2 = (x_1 x_2 - y_1 y_2) + i(x_1 y_2 + x_2 y_1)$   
(normal multiplication with  $i^2 = -1$ )
- Division:

$$\frac{z_1}{z_2} = \frac{z_1 z_2^*}{z_2 z_2^*} = \frac{x_1 x_2 + y_1 y_2}{x_2^2 + y_2^2} + i \frac{x_2 y_1 - x_1 y_2}{x_2^2 + y_2^2}$$

- Commutativity:  $z_1 z_2 = z_2 z_1$     $z_1 + z_2 = z_2 + z_1$
- associativity:  $(z_1 z_2) z_3 = z_1 (z_2 z_3)$     $(z_1 + z_2) + z_3 = z_1 + (z_2 + z_3)$
- distributivity:  $z_1 (z_2 + z_3) = z_1 z_2 + z_1 z_3$
- Trig inequality:  $|z_1 + z_2| \leq |z_1| + |z_2|$

## III.2 Differentiation

### III.2.1 open sets in $\mathbb{C}$

- Def: Let  $z_0 \in \mathbb{C}$ ,  $r > 0$ . Disk  $B_{r(z_0)} = \{z \in \mathbb{C} \mid |z - z_0| < r\}$  It is very important to note that it's not "less or equal"

Given a set  $\Omega \in \mathbb{C}$ , A point  $z_0 \in \Omega$  is called an interior point of  $\Omega$  if there exists  $r > 0$  s.t.  $B_{r(z_0)} \subset \Omega$ .

A set  $\Omega$  is **open** if every point of  $\Omega$  is an interior point of  $\Omega$ . In other words, there are no points on the boundary of  $\Omega$  that are included in  $\Omega$ .

### III.2.2 Holomorphic function

Let  $\Omega$  be an open set in  $\mathbb{C}$ , A function  $f : \Omega \rightarrow \mathbb{C}$  is called **holomorphic** at  $z_0 \in \Omega$  if the limit

$$f'(z_0) = \lim_{h \rightarrow 0} \frac{f(z_0 + h) - f(z_0)}{h} \quad (h \in \mathbb{C}, h \neq 0)$$

exists.

- The said function  $f(z)$  is holomorphic on  $\Omega$  if it is holomorphic on every point of  $\Omega$ .
- In the special case that  $f$  is holomorphic on  $\mathbb{C}$ ,  $f$  is an **entire** function.
- Holomorphic in 1st order guarantees holomorphic and analytic in any order and thus continuous.

### III.2.3 Differentiation operations

If  $f$  and  $g$  are holomorphic on  $\Omega$ , then

- $f + g$  is holomorphic on  $\Omega$ ,

$$(f + g)' = f' + g'$$

- $fg$  is analytic on  $\Omega$ ,

$$(fg)' = f'g + fg'$$

- $\frac{f}{g}$  is analytic and, if  $g(z) \neq 0$ ,

$$\frac{f}{g} = \frac{f'g - fg'}{g^2}$$

### III.2.4 Cauchy-Riemann equations

for complex function  $f : \Omega \rightarrow \mathbb{C}$ ,  $f(z) = u(x, y) + iv(x, y)$  that is holomorphic at  $z_0 = x_0 + iy_0$ , then the partial derivatives of  $u$  and  $v$  exist and satisfy the Cauchy-Riemann equations:

$$\partial_x u = \partial_y v, \quad \partial_y u = -\partial_x v$$

Conversely, if  $u$  and  $v$  are continuously differentiable on an open set  $\Omega$  and satisfy the Cauchy-Riemann equations, then  $f(z) = u(x, y) + iv(x, y)$  is holomorphic on  $\Omega$ .

In the language of logic, let  $C$  be “satisfying cauchy-riemann equations”, and  $H$  be “function is holomorphic”, then  $H \rightarrow C$ . If  $D$  is “ $u$  and  $v$  have continuous partial derivatives with respect to  $x$  and  $y$ ”, then  $(C \& D) \leftrightarrow H$
