Sample Spaces, collection of events, probability measure

- Sample space Ω : set of all possible outcomes of an experiment. Comes in n-tuples where n represents number of repeated trials.
- Collection of events \mathcal{F} : subset of state space to which we assign a probability.
- Probability measure: function that assigns a probability to each event. $P: F \to \mathbb{R}$.
 - ► Range is [0, 1].
 - $P(\Omega) = 1$ and $P(\emptyset) = 0$
 - For pairwise disjoint events $A_1, A_2, ...,$ $P(A_1\cup A_2\cup\ldots)=P(A_1)+P(A_2)+\ldots$

Sampling: Uniform, Replacement, Order

- · uniform sampling: each outcome is equally likely
- · Binomial coeff

$$\binom{n}{k} = \frac{n!}{k!(n-k)!} \tag{1}$$

Replacement

• ex: sample K distinct marked balls from N balls in a box, with Replacement

$$\Omega = \left\{1,2,3,...,N\right\}^K$$

$$\|\Omega\| = N^K$$

$$P(\text{none of the balls is marked 1}) = \frac{\left(N-1\right)^K}{N^K}$$
 (2)

• ex: sample K distinct marked balls from N balls in a box, without Replacement

$$\begin{split} \Omega &= \{(i_1,i_2,...,i_K) \ | \ i_1,...,i_K \in \{1,2,...,N\}, \text{distinct} \\ &\|\Omega\| = \binom{N-1}{K} \end{split}$$

$$P(\text{none of the balls is marked 1}) = \frac{\binom{N-1}{K}}{\binom{N}{K}} = \frac{N-K}{N} \end{split}$$
 (3)

▶ order matters: $A_n^k = \frac{n!}{(n-k)!}$ ▶ order doesn't matter: $\binom{n}{k} = C_n^k = \frac{n!}{k!(n-k)!}$

Infinite Sample Spaces

discrete

$$\Omega = \{\infty, 1, 2, \ldots\} \tag{4}$$

continuous

$$P([a',b']) = \frac{\text{length of } [a',b']}{\text{length of} [a,b]} \tag{5} \label{eq:5}$$

single point, or sets of points: $P(\lbrace x \rbrace) = P(\bigcup_{i=1}^{\infty} \lbrace x_i \rbrace) = 0$

Conditional Probability, Law of Total Prob., Bayes' Theorem, Independence

Conditional prob.

$$P(A|B) = \frac{|A \cap B|}{|B|} \Rightarrow P(AB) = P(B)P(A|B) \tag{6}$$

(new sample space is B, total number of outcomes is $A \cap B$)

Law of total probability:

Given partitions B_1, B_2, \dots of Ω ,

$$P(A) = \sum_{i} P(A|B_i)P(B_i) \tag{7}$$

Bayes' Theorem:

Given events A, B, P(A) and P(B) > 0,

$$P(B_i|A) = \frac{P(A|B_i)P(B_i)}{P(A)} \tag{8}$$

Considering the law of total prob., the generalized form, when B_i are partitions, is given as:

$$P(B_i|A) = \frac{P(A|B_i)P(B_i)}{\sum_{j} P(A|B_j)P(B_j)} \tag{9}$$

Independence:

$$P(AB) = P(A)P(B) \Leftrightarrow P(B|A) = P(B) \tag{10}$$

Note: By virtue of conventions, we write $A \cap B$ as AB in Probability.

If A,B,C,D are independent, it follows that P(ABCD) = P(A)P(B)P(C)P(D); however, the inverse is not always true.

• Independence of Random Variables (messy as hell...)

Given 2 random variables

$$\begin{split} X_1 \in \{x_{11}, x_{12}, x_{13}, ..., x_{1m}\} \\ X_2 \in \{x_{21}, x_{22}, x_{23}, ..., x_{2n}\} \\ \text{Random variables X_1 and X_2 are independent} \Leftrightarrow \end{split} \tag{11}$$

$$P\big(X_1=x_{1i},X_2=x_{2j}\big)=P(X_1=x_{1i})P\big(X_2=x_{2j}\big)$$

Need to check n*m equations to verify independence.

Conditional Independence:

For events $A_1, A_2, ..., A_n, B$, any set of events in A: A_{i1}, A_{i2}, A_{i3} , they are conditionally independent given B if

$$P(A_{i1}A_{i2}A_{i3}|B) = P(A_{i1}|B) * P(A_{i2}|B) * P(A_{i3}|B)$$
(12)

Independent Trials, Distributions

Bernoulli dirtribution:

a single trial, with success probability p, and failure probability 1-p. Prameter being the success probability.

$$X \sim \text{Ber}(p) \Rightarrow P(X = x) = p^x * (1 - p)^{1 - x}, x \in \{0, 1\}$$
 (13)

Binomial Distribution:

multiple independent Bernoulli trials, with success probability p, and failure probability 1-p. Parameters being the number of trials n and the success probability p.

$$X \sim \operatorname{Bin}(n,p) \Rightarrow P(X=k) = \binom{n}{k} p^k * (1-p)^{n-k}, k \in \{0,1,...,n\} \tag{14}$$

Geometric distribution:

multiple independent Bernoulli trials with success probability p, while stoping the experiment at the first success.

$$X \sim \text{Geom}(p) = p * (1-p)^{k-1}, k \in \{1, 2, ...\}$$
 (15)

Hypergeometric distribution:

There are N objects of type A, and $N_A - N$ objects of type B. Pick n objects without replacement. Denote number of A objects we picked as k. Parameters are N, N_A, n .

$$P(X=k) = \frac{\binom{N_A}{k} \binom{N-N_A}{n-k}}{\binom{N}{n}} \tag{16}$$

choose k from N_A, choose n-k from N-N_A, divide by total number of ways to choose n from N
