# Sample Spaces, collection of events, probability measure

- Sample space $\Omega$: set of all possible outcomes of an experiment. Comes in n-tuples where n represents number of repeated trials.
- Collection of events $\mathcal{F}$: subset of state space to which we assign a probability.
- Probability measure: function that assigns a probability to each event. $P : F \to \mathbb{R}$.
  - ▸ Range is $[0, 1]$.
  - ▸ $P(\Omega) = 1$ and $P(\emptyset) = 0$
  - ▸ For pairwise disjoint events $A_1, A_2, ...,$
    $P(A_1 \cup A_2 \cup ...) = P(A_1) + P(A_2) + ...$

---

# Sampling: Uniform, Replacement, Order

- uniform sampling: each outcome is equally likely
- Binomial coeff

$$\binom{n}{k} = \frac{n!}{k!(n-k)!} \tag{1}$$

## Replacement

- ex: sample K distinct marked balls from N balls in a box, **with** Replacement

$$\Omega = \{1, 2, 3, ..., N\}^K$$
$$\|\Omega\| = N^K \tag{2}$$
$$P(\text{none of the balls is marked 1}) = \frac{(N-1)^K}{N^K}$$

- ex: sample K distinct marked balls from N balls in a box, **without** Replacement

$$\Omega = \{(i_1, i_2, ..., i_K) \mid i_1, ..., i_K \in \{1, 2, ..., N\}, \text{distinct}$$
$$\|\Omega\| = \binom{N-1}{K} \tag{3}$$
$$P(\text{none of the balls is marked 1}) = \frac{\binom{N-1}{K}}{\binom{N}{K}} = \frac{N-K}{N}$$

### Order

- ▸ order matters: $A_n^k = \frac{n!}{(n-k)!}$
- ▸ order doesn't matter: $\binom{n}{k} = C_n^k = \frac{n!}{k!(n-k)!}$

---

# Infinite Sample Spaces

## discrete
$\Omega = \{\infty, 1, 2, ...\}$

## continuous

$$P([a', b']) = \frac{\text{length of } [a', b']}{\text{length of} [a, b]} \tag{4}$$
$$\text{single point, or sets of points: } P(\{x\}) = P(\cup_{i=1}^{\infty} \{x_i\}) = 0$$

- Complements: $P(A) = 1 - P(A^C)$

---

# Conditioinal Probability, Law of Total Prob., Bayes' Theorem, Independence

## Conditional prob.

$$P(A|B) = \frac{|A \cap B|}{|B|} \Rightarrow P(AB) = P(B)P(A|B) \tag{5}$$

(new sample space is B, total number of outcomes is $A \cap B$)

## Law of total probability:

Given partitions $B_1, B_2, \dots$ of $\Omega$,

$$P(A) = \sum_i P(A|B_i)P(B_i) \tag{6}$$

## Bayes' Theorem:

Given events A, B, P(A) and P(B) >0,

$$P(B_i|A) = \frac{P(A|B_i)P(B_i)}{P(A)} \tag{7}$$

Considering the law of total prob., the generalized form, when $B_i$ are partitions, is given as:

$$P(B_i|A) = \frac{P(A|B_i)P(B_i)}{\sum_j P(A|B_j)P(B_j)} \tag{8}$$

## Independence:

$$P(AB) = P(A)P(B) \Leftrightarrow P(B|A) = P(B) \tag{9}$$

Note: By virtue of conventions, we write $A \cap B$ as $AB$ in Probability.
If A,B,C,D are independent, it follows that $P(ABCD) = P(A)P(B)P(C)P(D)$; however, the inverse is not always true.
- Independence of Random Variables (messy as hell...)

Given 2 random variables

$$X_1 \in \{x_{11}, x_{12}, x_{13}, \dots, x_{1m}\}$$
$$X_2 \in \{x_{21}, x_{22}, x_{23}, \dots, x_{2n}\}$$

Random variables X_1 and X_2 are independent $\Leftrightarrow$

$$P(X_1 = x_{1i}, X_2 = x_{2j}) = P(X_1 = x_{1i})P(X_2 = x_{2j}) \tag{10}$$

Need to check n*m equations to verify independence.

## Conditional Independence:

For events $A_1, A_2, \dots, A_n, B$, any set of events in A: $A_{i1}, A_{i2}, A_{i3}$, they are conditionally independent given B if

$$P(A_{i1}A_{i2}A_{i3}|B) = P(A_{i1}|B) * P(A_{i2}|B) * P(A_{i3}|B) \tag{11}$$

# Independent Trials, Distributions

## Bernoulli dirtribution:

a single trial, with success probability p, and failure probability 1-p. Prameter being the success probability.

$$X{\sim}\mathrm{Ber}(p) \Rightarrow P(X = x) = p^x * (1 - p)^{1-x}, x \in \{0, 1\} \tag{12}$$

## Binomial Distribution:

multiple independent Bernoulli trials, with success probability p, and failure probability 1-p. Parameters being the number of trials $n$ and the success probability $p$.

$$X{\sim}\mathrm{Bin}(n, p) \Rightarrow P(X = k) = \binom{n}{k}p^k * (1 - p)^{n-k}, k \in \{0, 1, ..., n\} \tag{13}$$

## Geometric distribution:

multiple independent Bernoulli trials with success probability $p$, while stoping the experiment at the first success.

$$X{\sim}\mathrm{Geom}(p) = p * (1 - p)^{k-1}, k \in \{1, 2, ...\} \tag{14}$$

## Hypergeometric distribution:

There are N objects of type A, and $N_A - N$ objects of type B. Pick n objects without replacement. Denote number of A objects we picked as k. Parameters are $N, N_A, n$.

$$P(X = k) = \frac{\binom{N_A}{k}\binom{N-N_A}{n-k}}{\binom{N}{n}} \tag{15}$$

choose k from N_A, choose n-k from N-N_A, divide by total number of ways to choose n from N
